alternatives for shade from Ball Seed.

From Downy Mildew-tolerant New Guinea to best-in-class  
begonias, grasses, coleus and more, we can fill packs, pots,  
and baskets with shadeloving annuals to meet all needs.

BallSeed®

... together your  
shade Annuals offering!

# IDM Preventative Fungicide Recommendations

- Beacon impatiens exhibit high genetic resistance to IDM without the use of chemicals.
- While not immune to IDM, Beacon *can be grown successfully without preventative IDM fungicide applications.*
- It is not necessary to apply preventative fungicides for IDM disease management with Beacon Impatiens in either young plant or finish production.
  - If IDM prevention is part of an overall spray program for susceptible genetics, Beacon's performance will not be affected if they are also treated.
- Scenarios where preventative IDM fungicides may be recommended:
  - Plugs or plants are being produced where Impatiens are currently growing in the landscape, (which could expose greenhouse or nursery-grown plants to high levels of natural inoculum), and then shipping to other regions.
  - Receiving plugs or plants from a region where Impatiens are currently growing in the landscape and susceptible genetics are being grown at the recipient location.

# No-Risk Color for the Shade!

**High Resistance to Downy Mildew**

# Impatiens Beacon®

Rose

Formula Mix

Impatiens downy mildew disease led to a global decline in demand and sales of one of the top bedding plant classes, *Impatiens walleriana*.

- Beacon impatiens have high resistance to Impatiens downy mildew.
- Beacon offers the opportunity to increase sales in an important bedding and landscape segment, especially in markets where color for shade is needed.

## Tips for Landscape Growers

### Plant "fresh"

- Work on a plan with your grower for realistic timing on pre-season delivery.
- Note that root-bound plants suffer more transplant shock (depending on the species).

### Know your soil – pH & salts

- Strive for greater air porosity – you'll want more air than water!
- Organic matter increases air porosity.
- Soil pH, or how tight nutrients hold to soil (pH "range"):
- Less than 6.0 = Nutrients leached = Small leaves, marginal chlorosis
- Greater than 7.5 = Nutrients bound tight = Young leaf chlorosis, stunting
- Low EC causes small, weak plants.
- High EC causes marginal necrosis (brown edges) and stunted plants.

### Watering – 50% of landscape water is wasted!

- More plants die due to overwatering than to underwatering.
- Reduce water as plants fill in the beds.
- When leaves touch, they've had enough.

### Fertilization – 3 elements to promote plant health and growth

- N (nitrogen): "Gas" to grow.
- P (phosphorus): Stem stretch, roots and flowering.
- K (potassium): "Tone," or how rigid the plant is.

### Plant for success – Avoid soil compaction!

- Small beds
  - Cultivate the soil before planting.
  - When possible, work from perimeter – stay out of the bed.
  - Avoid "knee blight" – kneeling compacts the soil.
- Large beds
  - Cultivate from the center out and plant as you go, cultivate the edge and plant as you go, or work from one side to the other.
- Moisture content of plant tray soil should match the moisture content of the destination bed soil.
- Match crown of plant to the soil level, like you would if you were planting a tree.
